This growth inhibition is antagonised by globeralin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberallin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberallin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberallin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberallin biosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence is derived from the wheat rht gene.

```
its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by globerallin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with globerallin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being globerallin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit globerallin blosynthesis, such as paclobutazol, e.g. to allow use of a gibberallin blosynthesis inhibitor to keep weeds obtained after partially commend. The present sequence was
The specification describes polypeptides encoded by the Rht gene (and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  obtained after partially sequencing wheat Rht clone 14al

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Trilicum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants wild-type, the dwarfing out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis, such as paclobutrazol, dwarf but let crop plants grow tall. The present sequence represents the wheat Rht clone 5al genomic sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New Triticum Aestivum polynucleotides · encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence represents the composite DNA sequence of wheat Rht gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype
                                                                                                                                                                                                                                                                                                                                        pmologue; Triticum aestivum; wheat; growth inhibition;

This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants compounds which inhibit gibberellin blosynthesis, such as paclobutrazol, compounds which inhibit gibberellin blosynthesis, such as paclobutrazol, e.g. callow use of a gibberellin blosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by growth of the plant. This growth inhibition is antagonised by alounts. Conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with used to produce Rht mutant plants which are dwarfed compared with may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin blosynthesis, such as paclobutrazol, compounds which inhibit gibberellin blosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence represents the partial sequence of the maize D8-2023 allele.

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Asstivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberelin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologus gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis, such as paclobutrazol, dwarf but let crop plants grow tall. The present sequence represents the expressed sequence tag (EST) AAD39460, which is homologous to the

its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as pacibutrazol, e.g. to allow use of a gibberellin biosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence represents the maize lal genomic clone sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The specification describes polypeptides encoded by the Rht gene (and

```

```
The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin blosynthesis, such as pacloburrazol, e.g. to allow use of a gibberellin blosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence represents the partial cDNA sequence of rice AAD39460 (a wheat Rht gene homologue).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Rht gene; homologue; Triticum aestivum; wheat; growth inhibition; antagonist; glbberellin; dwarf phenotype; glbberellin blosynthesis;

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Trilicum Asstivum, inhibit growth of the plant. This growth inhibition is antagonised by globerellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by the treatment with globerellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being globerellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit globerellin blosynthesis, such as paclobutrazol, e.g. to allow use of a globerellin blosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence was contained after partially sequencing wheat Rht clone 5al.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Rht gene; homologue; Triticum aestivum; wheat; growth inhibition; antagonist; gibberellin; dwarf phenotype; gibberellin biosynthesis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is given in a specification relating to the structure and function of a regulatory gene, SCARECROW (SCR).

SCARECROW-like (SCL) genes encoding proteins containing an amino acid sequence similar to the sequence of MOTIF III (VHIID) of Arabidopsis SCR protein are disclosed. SCR and SCL genes are useful for producing transgenic plants whose cell division is modified and root and/or stem development and gravitropism of stem or hypocotyl is altered. Cell division is increased or decreased in roots resulting in thicker or finance root development. The transgenic plants are useful for expressing a gene of interest encoding a gene product that confers herbicide, salt, pathogen or insect resistance in root or embryos and genes encoding starch, lighth or cellulose biosynthesis in shoots. The SCR gene also confers less susceptibility to lodging in the transgenic plants than a wild-type plant. SCR gene sequences are also useful as molecular markers in the sequence are also useful as molecular markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Scarecrow gene; SCR gene; plant; regulatory gene; SCARECROW-like; SCL; transgenic plant; cell division; molecular marker; herbicide resistance;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Scarecrow gene useful for producing transgenic plants expressing genes whose product increases starch, lignin or cellulose biosynthesis and confers herbicide, pathogen or insect resistance

cactors which may be used to modify phenotype associated with a plant's sugar sensing characteristics and increasing yield when their expression level is altered. Sugars are central regulatory molecules that control superts of physiology, metabolism and development. Therefore the cDNAs and proteins of the invention are useful for modifying the growth and germination rates of plants, photosynthesis, glyoxylate metabolism, response, wounding response, cell cycle regulation, pathogen response, wounding response, cell cycle regulation, pathogen response, wounding response, cell cycle regulation, pagnetations, plants in seeds, tubers, roots, and other storage organs leading to an increase in yield. The transcription factor polynucleotides and polypeptides may be used to alter the structure and developmental characteristics of plants such as soybean, wheat, corn, potato, cotton, rice, oilseed, sunflower, alfalfa, sugarcane, turf, banana, blackberry, blueberry, strawberry, raspberry, cantaloupe, carrot, cauliflower, coffee, cucumber, eggplant, grapes, honey dew, lettuce, mango, melon, conion, papaya, peas, pepers, pineapple, spinach, squash, sweet corn, tobacco, tomato, watermelon, rosaceous fruits and/or vegetable brassicas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Transcription factor; biochemical characteristic; controlling element; structural characteristic; developmental characteristic; gene therapy; agricultural biotechnology; plant trait modification; ss.

```

Plant transcription factor; phenotype; sugar sensing characteristic;

```
The present sequence is Arabidopsis thaliana transcription factor, G307 cDNA. The transcription factor is used for altering a plant's blochemical characteristics. The transcription factor may be used to blochemical characteristics of plants be used to alter the structure and developmental characteristics of plants such as soybean, wheat, corn, potato, cotton, rice, oilseed rape, sunflower, alfalfa, sugar cane, turf, banana, blackberry, blueberry, strawberry, raspberry, cantaloupe, carrot, cauliflower, coffee, cucumber, eggplant, grapes, honey dew, lettuce, mango, melon, onion, papaya, peas, peppers, plneaple, spinach, squash, sweet corn, tobacco, tomato, watermelon, cosaceous fruits and/or vegetable brassicas. Transcription factors are key controlling alements of biological pathways and altering expression levels of or more transcription factors can change entire biological pathways in an organism. Therefore manipulating transcription factor fevels in plants offers great potential in agricultural biotechnology for modifying a plant's traits. Transcription factor cDNA is useful in
                                                                                                                                                                                                                                                                                                             Nucleic acids encoding plant transcription factor polypeptides, useful for altering the biochemical characteristics of plants e.g. corn,

The patent relates to polynucleotides encoding 35 plant transcription factors which may be used to modify phenotype associated with a plant's sugar sensing characteristics and increasing yield when their expression level is altered. Sugars are central regulatory molecules that control aspects of physiology, metabolism and development. Therefore the CDNAs and proteins of the invention are useful for modifying the growth and germination rates of plants, photosynthesis, glyoxylate metabolism, response, wounding response, cell cycle regulation, pathogen response, wounding response, cell cycle regulation, pathogen relationships in seeds, tubers, roots, and other storage organs leading to an increase in yield the transcription factor polynucleotides and polypeptides may be used to alter the structure and developmental characteristics of plants such as soybean, wheat, corn, potato, cotton, rice, oilseed, sunflower, alfalfa, sugarcane, turf, banana, blackberry, collee, cucumber, eggplant, grapes, honey dew, lettuce, mango, meton, of the plants, peas, peas, peppers, plicapple, spinach, squash, seet, con, onlon, papaya, peas, peppers, plicapple, spinach, squash, seet, con,
            transgenic plant; plant yield; growth; germination; photosynthesis; glyoxylate metabolism; respiration; pathogen response; wounding response; cell cycle regulation; pigmentation; flowering; senescence; physiology;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            acco, tomato, watermelon, rosaceous fruits and/or vegetable brassicas. present sequence is an Arabidopsis thaliana transcription factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acids encoding plant transcription factor polypeptides, useful for altering the sugar sensing characteristics of plants and increasing yield, e.g. corn, potato and cotton plants -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Riechmann JL;

                                            insensitivity (gai) gene product (GAI), the expression of which inhibits plant growth. However the inhibition is antagonised by cibberellin (GA), while gai expression confers a dwarf phenotype that is insensitive to GA. Manipulating gai and GAI expression confers to produce tall or dwarf plants, particularly the latter for increased resistance to lodging and increased yield. It may also allow regulation of flowering, i.e. plants remain in the vegetative state until treated with GA, useful to inhibit bolting in spinach and lettuce. GAI can be used to raise specific antibodies for identifying homologous proteins or genes in other species. gai fragments can also be used as probes or primers to identify and colone related sequences, or in the preparation of antisense or sense expression regulating (co-suppressing) sequences. Rice plants that express GAI may be resistant to Bakane disease. Manipulation of gai and GAI makes it possible to tailor the degree of dwarfism
                                    The present sequence encodes the Arabidopsis thaliana gibberellin

GRAS protein; BZH gene; transcription factor; gibberellin; morphogeneals; plant development; dwarf plant; crucifer; ss.
                                                                                                                                                                                             The present sequence encodes a wild type plant protein of the GRAS family. The specification describes a mutant allele of the BZH gene, which contains a G1695A mutation resulting in the mutation E546K in the protein. GRAS proteins are transcription factors implicated in regulation of the response to gibberellins and thus in control of morphogenesis and plant development. The mutant GRAS protein is used to produce dwarf plants, specifically cruoifers. Dwarf plants may be sown earlier (increasing nitrate accumulation without risking excessive stem growth during winter), and have better resistance to cold and lodging. They are also easier to harvest and allow for better monitoring of the crop.
                                                                            а
                                                                    New mutant nucleic acid encoding modified GRAS family protein, used produce dwarf transgenic plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       seq_name: /SIDS2/gcgdata/geneseq/geneseqn/NA2001.DAT:AAF25481

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAX36283;
     The present sequence encodes a mutant plant protein of the GRAS family. The mutant allele of the BZH gene contains a G1695A mutation resulting in the mutation E546K in the protein. GRAS proteins are transcription factors implicated in regulation of the response to gibberellins and thus in control of morphogenesis and plant development. The mutant GRAS protein is used to produce dwarf plants, specifically crucifiers. Dwarf plants may be sown earlier (increasing nitrate accumulation without risking excessive stem growth during winter), and have better resistance to cold and lodding. They are also easier to harvest and allow for better monitoring of the crop.

```
The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants can be wild-type, the dwarfing being gibberellin-insensitive gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence was contained after partially sequencing wheat Rht clone 14al.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is
New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              mologue; Triticum aestivum; wheat; growth inhibition;

plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as pacibutrazol, e.g. to allow use of a gibberellin biosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence represents the partial sequence of the wheat rht-10 allele.
                                                           The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Rht gene; homologue; Triticum aestivum; wheat; growth inhibition; antagonist; gibberellin; dwarf phenotype; gibberellin biosynthesis;
antagonised by gibberellin, used to confer a dwarf phenotype

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit: growth of the plant. This growth inhibition is antagonised by gibberallin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberallin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberallin-insensitive. Tabler plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberallin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberallin biosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence was cobtained after partially sequencing wheat Rht clone 14al.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 vea brasiliensis S-hydroxy:nitrilase - and recombinant equivalent
high specific activity, for chiral synthesis of cyano:hydrin(s)
(S)-cyanohydrins from aldehyde and hydrogen cyanide. Recombinantly produced S-HN has higher specific activity than native S-HN, probably due to post translational modification differences between plants and microorganisms.

S-HN was isolated from H. brasiliensis leaves by homogenisation, followed by sequential chromatography on QAE-Sepharose FF, Phenyl-Sepharose and Biogel P180. A cDNA bank from the same source was prepared and screened with polyclonal rabbit antiserum raised against the isolated enzyme. The insert, about 1.1 kb, in the single positive clone was cloned into pHNLL00 and sequenced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence encodes the Hevea brasiliensis
S-hydroxynitrilase (S-HN), which can be used for the chiral
synthesis of aliphatic or aromatic S-cyanohydrins from HCN, or its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Schall M;

than the native enzyme.

H. brasiliensis leaves were homogenised in cold pH 6.5 K phosphate buffer, and the extract subjected to sequential chromatography on OAB-Sepharose, Phenyl-Sepharose and BioGel 150 to recover a protein with a specific activity of 19 IU/mg.

A CDNA library was prepared from young H. brasiliensis leaves in Zap phage, and screened with polyclonal rabbit antiserum raised against the purified enzyme. The insert in one positive clone was isolated, and ligated into pBluescript to form pHNL-100. This plasmid, in E. coli SOLK, expressed a fusion protein with lacz that was immunoreactive. Sequencing showed that the insert in this plasmid was not complete, and the missing 5'-end generated by 2 stage PCR, resulting in plasmid pHNL-101, containing the entire
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /*tag= a

This nucleic acid sequence is a cDNA coding for human KSGal6ST (Keratan sulphate 6-sulphotransferaes). The sequence was obtained by radiolabelling the cDNA of chick chondroitin 6-sulphotransferaes (C6ST) and using this as a probe in a random oligonucleotide-primed labelling method. Human foetal brain cDNA was inserted into a phage Lambda gill cloning vector whereby the clones containing the KSGal6ST were obtained by hybridization using the prepared probe. The positive clones were subcloned into a recombinant expression vector and used to transform (C6ST) calls, from which calls expressing KSGal6ST can be selected. The phage cDNA inserts were isolated and subcloned into a Bluescript plasmid. Deletion clones were then prepared from which both strands were sequenced betton clones method. The KSGal6ST can which both strands were sequenced sulphate from a sulphate donor to galactose 6-0H groups in keratan sulphate, but does not transfer sulphate to chondroitin, chondroitin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Porcine reproductive and respiratory syndrome; PRRS; pig; vaccine;

The present sequence is that of open reading frame (ORF) 1b of porcine reproductive and respiratory syndrome (PRRS) virus strain ATCC VR-2332. It encodes a 1457 annio acid viral protein (see AAB82665). The invention provides live attenuated PRRS viruses which are attenuated by at least 1 amino acid mutation in a specific site of the viral protein coded by ORF 1b or ORF 2. A claimed live attenuated PRRS virus has at 1 east 1 of the amino acids in positions 321-341 of the ORF1a-encoded protein (see AAB8265), and/or at least 1 of the amino acids in positions 321-341 of the amino acids in positions 1-20 of the ORF 2-encoded protein (see AAB82667) deleted. Of the ORF 1b-encoded protein, and/or at least 1 of the amino acids in positions 1-20 of the ORF 2-encoded protein (see AAB82667) deleted. Other claimed live attenuated PRRS viruses have amino acid 31 of ORF2 deleted or replaced by an amino acid not identical to that of ARCC VR-2332. Specific mutations are created using molecular claimed. The live attenuated PRRS viruses are used in the manufacture of a vaccine for the prophylaxis and treatment of PRRS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Porcine reproductive and respiratory syndrome virus; PRRSV; vaccine; plg; attenuated virus; \ensuremath{\text{ds}} .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides a novel method of producing attenuated versions of viruses, using multiple passage through cell cultures and involving the removal of samples of the virus prior to the induction of cytopathic effects. The sample is then inoculated into the next cell culture. The sequence of the naturally-occurring Lelystad virus (also known as the porcine reproductive and respiratory syndrome virus or PRRSV) atypical strain JA-142 is provided, along with that of a modified version of the virus. The modified version can be used in the vaccination of pigs against the Lelystad virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                reproductive and respiratory syndrome virus; PRRSV; vaccine; pig;

```

```
The present invention provides a novel method of producing attenuated versions of viruses, using multiple passage through cell cultures and involving the removal of samples of the virus prior to the induction of cytopathic effects. The sample is then inoculated into the next cell culture. The sequence of the naturally-occurring Lelystad virus (also known as the porcine reproductive and respiratory syndrome virus or PRRSV) atypical strain JA-142 is provided, along with that of a modified version of the virus. The modified version can be used in the vaccination

The present sequence is that of cDNA corresponding to the North American porcine reproductive and respiratory syndrome (PRRS) virus isolate P129A RNA genome. The cDNA in plasmid p77129A is deposited as ATCC 20348B. The P129 virus was originally isolated from a struct solated repeated from a severe PRRS outbreak, and plaque purified virus P129A was obtained after 10 serial passages from the pig. The DNA sequence includes 8 oper reading frames (ORRS 1a, 1b, 2-7) encoding polyproteins comprising protease, replicase and helicase functions, small membrane pycoproteins, a major envelope crocein, an integral membrane protein and a nucleocapsid protein. The invention provides isolated polynucleotide molecules, plasmids, viral vectors and transfected host cells that comprise plasmids, viral vectors and transfected host cells that comprise molecules, viral vectors and transfected host cells encoding genetically modified North American PRRS viruses that are disabled in their ability to cause PRRS. The invention also provides comprises comprise and other animals. Vaccines comprises and other animals. Vaccines may also comprise a genetically modified North American PRRS viruses that are disabled and North American PRRS viruses that are disabled and North American PRRS viruses, viral vectors and enthods of using these a genetically modified North American PRRS virus comprises and particular personal comprises. New polynucleotide encoding an infectious RNA molecule of a North American porcine reproductive and respiratory syndrome virus for use as a vaccine in protecting swine and other animals from infection by a more heterologous antigenic epitopes, or a plasmid encoding such a PRRS virus. Also provided are isolated polynucleotide molecules, viral vectors, and transfected host cells that comprise a nucleotide sequence encoding a peptide of a North American PRRS virus. These are useful in providing peptides to compensate for mutated peptide coding sequences of DNA sequences encoding genetically modified North American PRRS viruses so that functional virions can be Claim 1; Page 24-29; 53pp; English. pathogen

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by the treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. Primers AAX36234-X36254 were used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Rht gene; homologue; Triticum aestivum; wheat; growth inhibition; antagonist; gibberellin; dwarf phenotype; gibberellin biosynthesis; paclobutrazol; D8 gene; maize; sequencing primer; ss.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ONF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ONF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide

Helicobacter pylori has been strongly linked to chronic gastritis and duodenal ulcer disease. The nucleic acid sequences of the invention are used to evaluate compounds, especially activators or inhibitors of bacterial life cycle, for the ability to bind an H. pylori nucleic acid sequence. The nucleic acid sequences, and corresponding proteins, are also useful for generating vaccines for immunising subjects against H.
production, e.g. in E. coli hosts.
Note: This DNA sequence is not reproduced in the specification and has
been derived from the related specification, WO9719098.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      3-JUN-
        pylori or for use in detecting the presence of Helicobacter species in a sample. Antisense nucleic acid sequences of these sequences are used to inhibit expression of a gene from Helicobacter species. H. pylori whole genomic DNA was isolated and nebulised to a median size of 2000 bp. Purified DNA fragments were blunt-ended and ligated to unique batxII-linker adapters in 100-1000 fold molar excess. These linkers are complementary to the BstXI-cut pMPX vectors, while the overhang is not self-complementary. Therefore the linkers will not concatemerise nor will the cut vector re-ligate itself easily. The linker-adapter inserts shotgun subclone libraries. The purified DNA samples were then
                                                                                                                                                                       Note: The ORF/protein reference number for this sequence was obtained from the related specification, WO9640893.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Hybridisation assay; genetic mapping; gene expression control; protein identification; signal transduction pathway; metabolic pathway; promoter; termination sequence; ss.

Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 73 ORFs are shown. The proteins are variously cell envelope proteins,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Helicobacter pylori nucleic acids and proteins - used to develop products for the detection, prevention and treatment of H. pylori infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          seq_name: /SIDS2/gcgdata/geneseq/geneseqn/NA1998.DAT:AAX30475

secreted proteins or other cellular proteins. Vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least 8 nucleotides from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cytoplasmic; vaccine; prevention; treatment; infection; envelope; identification; binding compound; bacterium; life cycle; activator; bacteria; inhibitor; duodenal ulcer disease; chronic gastritis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Helicobacter pylori nucleic acid sequences and related polypeptide(s) - useful for vaccines to treat or prevent H. pylori

infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55/59) was determined from coverlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 protein; Helicobacter infection; gastroduodenal disease; gastritis;

Claim 1; Page 391-394; 2054pp; English.

This sequence encodes a H. pylori inner membrane protein. The protein may be used in a vaccine to prevent or treat H. pylori

32

```
This sequence represents a polynucleotide of the invention. It was isolated from Helicobacter pylori and encodes a H.pylori GHPO protein. The polypeptides can be used for preventing or treating Helicobacter infections, and gastroducdenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, and peptic ulcar diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           and its flanking regions was determined (AAQ66797). The spheroidin gene can be used as the location for insertion of heterologous DNA in insect and mammalian expression systems. A spheroidin-like gene was also identified in CDEPV and its amino acid sequence was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New entomopoxvirus polynucleotide sequences, proteins and vectors - are used for expression of heterologous proteins in both insect and mammalian host cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence of the Amsacta moorel entomopoxvirus spheroidin gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Spheroidin; gene expression; vector; insect cell culture;

```
The sequence. It is used to make the expression systems of the invention. The specification describes an EPV expression system that is capable of directing the replication and expression of a heterologous gene in a selected host cell. The expression system comprises an EPV promoter sequence operably linked to the selected heterologous gene in a selected host cell. The expression of selected heterologous gene sequence operably linked to the selected proteins in the expression system is used for the expression of sequence. The expression of selected proteins in insect and mammalian host cells e.g. human, rodent and primate cells. EPV thymidine kinase and spheroidin genes can also be used in vertebrate poxylivuses such as vaccinia and swinepox virus. The expression vectors can also be used for the control of insect pests through the insertion of a gene encoding an insect toxin into the expression vector which will infect the target pest and produce large quantities of the toxin. Spheroidin and thymidine kinase are nonessential chert are capable of operating in a vertebrate poxylivus (e.g. vaccinia) they are capable of operating in a vertebrate poxylivus (e.g. vaccinia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             present sequence represents an Entomopoxvirus (EPV) spheroidin-like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel expression system for the expression of heterologous sequences in insect and mammalian host cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Spheroidin; Entomopoxvirus; expression system; replication; heterologous gene expression; thymidine kinase; poxvirus; vaccinia; swinepox virus; insect pest control; immunity; ss.

The present sequence represents an Entomopoxvirus (EPV) spheroidin-like gene sequence. It is used to make the expression systems of the invention. The specification describes an EPV expression system that is capable of directing the replication and expression of a heterologous gene in a selected host cell. The expression system comprises an EPV promoter sequence operably linked to the selected heterologous gene sequence operably linked to the selected heterologous gene promoter sequence operably linked to the selected proteins in heterologous sequences and the production of selected proteins in the the thymidine kinase and spheroidin genes can also be used in vertebrate poxviruses such as vaccinia and swinepox virus. The expression vectors can also be used for the control of insect pests through the insertion of a gene encoding an insect toxin into the expression vector scan also be used for the control of insect pests through the insertion of a gene encoding an insect toxin into the capterial protein which which will infect the target pest and produce large quantities of the toxin. Spheroidin and thymidine kinase are nonessential proteins which makes them ideal for the insertion of exogenous DNA and mammalian coll expression vectors whom we have the provential provider sequences are nonessential provided by the control of insect poxvirus (e.g. vaccinia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel expression system for the expression of heterologous sequences in insect and mammalian host cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               mammalian cell expression vector system. The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Asstivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made which are resistant to the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis such as paclobutrazol, dwarf but let crop plants grow tall. The present sequence was dwarf but let repartially sequencing wheat Rht clone 5al.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Rht gene; homologue; Triticum aestivum; wheat; growth inhibition; antagonist; gibberellin; dwarf phenotype; gibberellin biosynthesis;

The proteins can have activities based on the tissues and calls they are expressed in, such as: antiinflammatory; antirheumatic; antiarthritic; immunosuppressive; antibacterial; endocrine; cardiant; central nervous system, virucide; anti-HIV; fungicide; antimutagen; cardiovascular; antianaemic; antiaggregant; haemostatic; vulnerary; antiulcer; osteopathic; dermatological; antialergic; antiasthmatic; antiparkinsonian; and immunostimulant. The proteins and polynucleotides encoding them can be used in gene therapy, antisense therapy and vaccine production, The proteins and polynucleotides are useful for screening for agonists or antagonists of a protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation,

The present invention describes a purified or isolated nucleic acid sequence (I) consisting essentially of one of the 93 nucleotide sequences yequence (I) consisting essentially of one of the nucleic acid in a microorganism is capable of inhibiting proliferation of a microorganism. (I) have antibacterial and antibiotic activities, and can be used in gene therapy. Expression of (I) in a microorganism inhibits proliferation of the microorganism on the manufactured antibiotic is useful for reducing the activity or level of a gene product required for proliferation of a microorganism in a subject, specifically humans. The nucleic acids that inhibit bacterial growth or proliferation can be used
rheumatoid arthritis, septic shock, pancreatitis, cardiac dysfunction, neuropathology, cardiac anaphylaxis, viral, bacterial, HIV and fungal infections, autoimmunity, genetic diseases, haematopoietic diseaders, anaemia, platelet disorders, thrombocytopaenia, wounds, burns, ulcers, osteoporosis, severe combined immunodeficiency, eczema, allergic rhintits, asthma, diabetes, cancer, multiple sclerosis, depression, Alzheimer's disease, parkinson's disease, neurodegenerative and neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Escherichia coli protein encoding nucleotide sequence SEQ ID NO:262
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 nucleic acids encoding proteins required for Escherichia coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Escherichia coli; identification; proliferation; microorganism; antimicrobial; antibacterial; antibiotic; gene therapy; diagnosis; bacterial growth inhibition; ds.

as antisense therapeutics for killing bacteria. In addition to therapeutic applications, the nucleic acid sequences complementary to sequences required for proliferation can be used as diagnostic tools. For example, nucleic acid probes complementary to proliferation-required sequences that are specific for particular species of microorganisms can be used as probes to identify particular microorganism species in clinical specimens. AAMB1295 to AAMB1487 encode the Escherichia coli proteins given in AAG98239 to AAAB41431, and AAH81488 to AAMB1491 represent oligonucleotides, which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ξ

AAZ54576 and AAZ54616 to AAZ5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine;

```
represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ5457 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as manufacture of medicaments for treating or preventing in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agentis. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy; ds.

```
AAQ71977 is the DNA sequence of murine IL-2R gamma AAR59094, this was used in the development of a claimed method for the diagnosis of X-linked severe combined immunodeficiency (XSCID), in female carriers and male sufferers.
                                                                                                                                   Diagnosis of X-linked severe combined immunodeficiency (XSCID) comprises detecting mutated IL-2R gamma gene, also vectors and transgenic animals containing the mutated gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               seq_name: /SIDS2/gcgdata/geneseq/geneseqn/NA2001.DAT:AAS06754

    AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54577 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves may also be used in gene therapy protocols.

diagnosing and/or treating e.g. cancer, immune, cardiovascular and neuronal-associated diseases, and microbial infections -

Example 1; Figure 1; 433pp; English.

AASO6701-AASO6757 encode for novel human protein kinases #1-57. The
novel protein kinases have been identified as members of the tyrosine
or serine/threonine kinase (PTK and STK) families. The polynucleotides
concoing protein kinases and the polypeptides may be used in the
prevention, diagnosis and treatment of diseases associated with
the prevention, diagnosis and treatment of disease associated with
the prevention, diagnosis and treatment of disease associated with
the prevention of an ancers of haematopoletic origin), cardiovascular
cancers (e.g. atherosclerosis), metabolic disorders (e.g. diabetes),
immune related diseases (e.g. rheumatoid arthritis), neurological
disorders (e.g. schizophrenia), neurodegenerative disorders (e.g. asthma), infectious
cdisorders (e.g. HIV) and reproductive disorders (e.g. infertility).
Additionally, polynucleotides encoding protein kinases may be
used for gene therapy and as DNA probes in diagnostic assays.
Che protein kinase polypeptides may be used as antigens in the production
of antibodies against the protein kinases and in assays to identify
modulators of protein kinase expression and activity.

/note="Vector: pBK-CMV; Site_1: EcoRI; Site_2: XhoI; This conA library was constructed from polyA+ enriched mRNA from green seed coats in mid to late developemental stage, average fresh weight 250 map per seed. Traces of pod and embryo tissue also present. Complementary DNA was synthesized from mRNA using an XhoI-poly(dT)
linker-primer. EcoRI adopters were ligated to the blunt-ended cDNA fragments and the products were digested with XhoI for directional cloning into lambda ZAP Express vector. This lambda library was amphilied once using E. coli host strain XLI Blue MRF'. Inserts were then subcloned by mass excision using ExAssist helper phage for conversion into phagemid vector pBK-CMV in E. coli host
                                                                                                                                                                                                                                                                                                                                                                                                                                         Eukaryophyta; Tracheophyta; Embryophyta; Tracheophyta; Spermatophyta; Magnoliophyta; eudicotyledons; core eudicots; Rosidae; eurosids I; Fabales; Fabaceae; Papilionoideae; Phaseoleae;
